

The following procedure can be used to repair a corrupted halFILE basket (halFILE error mssg: 3104 Database already exists)

1. Get all users out of the basket that is corrupt.
2. Go to the halFILE menu File | Baskets and select the basket that is corrupt.
3. At the top of the Basket configuration frame you will see Basket Database File name in the form AAAXX###.mdb where AAA= Application ID, XX=Document type (or two character database id) and ### is the basket number given to the basket. Record this file name for future reference.
4. Exit out of the Basket screen and go to the menu Tools | Repair database.
5. Select the AAAXX### file which will normally be the default drive. It should reside in the halFILE program folder.
6. Answer YES to the prompt about repairing the database (although it says it may take a long time, usually it is fast).
7. When the repair process is complete, proceed with using the basket.
